

63A and 80A distribution boxes

Article Overview

63A and 80A distribution boxes are electrical enclosures designed to safely distribute power at 63-ampere and 80-ampere capacities, commonly used in construction, industrial, and commercial settings.

Overview

63A distribution boxes are typically used for medium-power applications such as construction sites, events, and temporary installations. They provide a safe and organized way to distribute electricity from a main supply to multiple circuits, often featuring protective breakers, lockable covers, and handles for portability. 80A distribution boxes are designed for higher power requirements, suitable for larger installations or permanent setups. They can handle greater current loads and are often used in industrial or commercial environments where multiple high-power devices need simultaneous operation.

Key Features

- **Input/Output Capacity:** 63A boxes handle up to 63 amperes, while 80A boxes handle up to 80 amperes. Both types can include multiple output sockets or terminals for connecting various devices.
- **Mounting Options:** Boxes can be DIN-rail mounted for fixed installations or portable with handles for temporary setups.
- **Protection:** Most boxes include circuit breakers, lockable covers, and water-resistant designs to protect against environmental hazards.
