

90-degree slope for mesh cable trays

Overview

A vertical inside bend is a fitting used to change the direction of a cable tray system vertically, typically at a 90-degree angle, directing cables inward. This component is essential for installations where cables need to transition vertically while maintaining proper organization. Learn how to cut, bend, and assemble mesh cable trays to create T-branches, cross-overs, 90° bends, and rising or falling bends. One kit contains hardware for one tee or two 90-degree bends. Slotted design fits any size tray and eliminates precise tray alignment. This product meets the material restrictions of Article 4 of the RoHS. The Cable Tray Slope & Fabrication Calculator is a field-ready tool for electrical construction workers who need to quickly calculate V-cut dimensions, bolt hole positions, slope length, and hanger spacing for inclined cable tray installations. Use this tool to estimate sloped section length, horizontal run requirement, cut marks, and installation feasibility. Including appropriate fastening material.
