

A set of optical power meter and red light pen

Article Overview

A red light pen integrated with an optical power meter allows simultaneous optical power measurement and visual fault location in fiber optic networks.

Overview

A red light pen, also known as a Visual Fault Locator (VFL), is a tool that emits a 650nm red laser through optical fibers to visually identify breaks, bends, or poor connections. When combined with an optical power meter (OPM), the device can both measure absolute or relative optical power and locate faults in a single handheld unit, streamlining fiber testing and maintenance tasks .

Key Features

- **All-in-One Functionality:** Combines optical power measurement and fiber fault detection, reducing the need for multiple devices .
- **Wavelength Compatibility:** Many devices support multiple calibrated wavelengths (e.g., 850nm, 1310nm, 1550nm) for accurate power readings across different fiber types .
- **Portability and Durability:** Compact, lightweight, and rugged designs make them suitable for field use, often with ergonomic construction and long battery life .
- **User-Friendly Operation:** Features like backlight adjustment, wavelength memory, frequency recognition, and simple on/off controls for the red light enhance usability .
