

Bahamas Four-Station Energy Internet

Article Overview

The Bahamas is implementing a multi-station energy network integrating solar power, battery storage, and modernized grids to enhance reliability, sustainability, and affordability.

Overview of the Four-Station Energy Network

The "Four-Station Energy Internet" in The Bahamas refers to a coordinated energy infrastructure across New Providence and the Family Islands, combining utility-scale solar, hybrid microgrids, battery energy storage systems (BESS), and upgraded transmission and distribution networks. This initiative is part of the New Energy ERA, designed to modernize the electricity grid, reduce reliance on fossil fuels, and improve resilience against natural disasters.

Key Components

1. Solar Power Integration

- New Providence: 70 MW of solar power integrated with 35 MW of BESS to stabilize the grid and store excess energy for peak demand periods.
 - Family Islands: 27 MW of solar distributed across islands, with each island having a customized hybrid grid plan to meet local energy needs and reduce costs.
- #### 2. Battery Energy Storage Systems (BESS)
- Large-scale batteries store solar energy for use during low sunlight or high-demand periods, ensuring consistent and reliable power.
- #### 3. Grid Modernization
- New switching stations, transmission lines, substation protections, and voltage regulation systems enhance grid resilience and reliability.
