

Bring fiber optic cable to home

Article Overview

Getting fiber optic internet to your home involves a combination of provider planning, physical cable installation, and in-home setup with specialized equipment.

Step 1: Check Availability and Contact a Provider

First, confirm that fiber optic service is available in your area. Not all neighborhoods have fiber infrastructure yet. Contact local ISPs to schedule a site survey, where a technician assesses the best way to bring fiber to your property, considering terrain, utility lines, and obstacles like driveways or waterways .

Step 2: Choose Installation Type

Fiber can be installed in two main ways:

- **Underground Installation:** A trench is dug from the street distribution point to your home, and a conduit is laid for the fiber cable. Directional boring may be used to minimize disruption when crossing driveways or sensitive landscaping .
- **Aerial Installation:** If utility poles are available, fiber is strung overhead from the nearest pole to your home. This method is faster and less expensive but more exposed to weather .

Step 3: Install the Network Interface Device (NID)

A small box called a Network Interface Device (NID) is installed on the outside of your home. The fiber drop cable from the street or pole is connected here, and the fiber is coiled safely inside .

Step 4: Set Up the Optical Network Terminal (ONT)
