

Cable trays that can also be used as conduits

Article Overview

Cable trays do not inherently require conduits, but conduit may be necessary in certain environments for added protection or code compliance.

Cable Tray Basics

Cable trays are open structural pathways designed to support and organize multiple cables, including power, control, and data lines. They allow for easy installation, maintenance, and future expansion, and their open design promotes heat dissipation, reducing the risk of cable derating or insulation degradation. Tray cables, often labeled TC or TC-ER, are specifically manufactured to withstand industrial environments and can be installed directly in trays without conduit under normal conditions.

When Conduit Is Not Required

Tray cables can be installed without conduit if:

- They are placed in a listed cable tray system.
- Exposed runs outside the tray are short (up to 6 feet) and use TC-ER-rated cables.
- The installation environment does not pose a risk of mechanical damage, moisture, or chemical exposure. In these cases, the tray itself provides sufficient support and organization, and the robust jacketing of tray cables offers moderate protection.
