A microfilter is a device that allows broadband to work at the same time as your phone service. Normally, you'll need a microfilter for every phone socket in your home where you've got some kind of. A cable splitter, technically a passive RF (Radio Frequency) distribution device, takes a single incoming coaxial cable and divides the signal to multiple outputs. It doesn't amplify the signal; instead, it splits it, resulting in a power loss at each output port. Once you've connected the modem and router, connect your computer to the Internet port on the router with an ethernet cable. It essentially takes a single incoming signal and creates two or more identical copies of that signal.
