

DML the core switch in the Netherlands

Article Overview

DML serves as a core network switch in the Netherlands, providing high-speed connectivity and acting as a central hub for data center and fiber network interconnections.

Overview of DML

DML is recognized as a core switch in the Netherlands, functioning as a central node in the country's data center and fiber network infrastructure. Core switches like DML are critical for high-capacity routing and switching, connecting multiple data centers, internet exchanges, and carrier networks to ensure low-latency, high-throughput communication across the region. These switches typically operate at the network backbone layer, handling large volumes of traffic and supporting advanced features such as redundancy, high availability, and scalable bandwidth.

Integration with Dutch Data Centers

DML is closely associated with Switch Datacenters, a leading operator of sustainable, high-density, AI-ready facilities in the Amsterdam region. Switch Datacenters operates multiple sites including AMS4, AMS6, and AMS7, all designed for low PUE (1.1), 100% renewable energy, and flexible cooling options. These facilities are strategically located near major fiber routes and internet exchanges, such as AMS-IX, enabling DML to serve as a central interconnection point for cloud providers, ISPs, and enterprise networks.

Technical and Operational Features

While specific hardware details of DML are not publicly disclosed, core switches in this context typically support:
