

Distribution box cable 5 wires

Article Overview

A distribution box with five wires uses a three-phase system with three phase wires, one neutral wire, and one protective ground wire, each with specific color codes and installation requirements.

Components of a Five-Wire System

A typical three-phase five-wire system includes:

- Three phase wires (A, B, C): Carry the alternating current for each phase. Standard colors are A: yellow, B: green, C: red.
- Neutral wire (N): Returns current and balances the system; standard color is light blue.
- Protective earth (PE) wire: Provides grounding for safety; standard color is yellow-green .

This system is commonly used in residential, commercial, and industrial installations to provide reliable power and allow for both three-phase and single-phase loads .

Wiring in the Distribution Box

When connecting a five-wire cable in a distribution box:

- Phase wires are connected to the corresponding circuit breakers or busbars.
- Neutral wire is connected to the neutral busbar; repeated grounding of the neutral is prohibited to avoid safety hazards .
- Protective earth wire is connected to the grounding busbar and may be repeatedly grounded for safety .
