

Electrical conduit and cable tray

Overview

Conduit systems are enclosed pipes that require precise bends, threading, and pulling. Cable trays, on the other hand, create an open channel for cables. Understanding the types of cable containment systems, including trays, trunks, and conduits, helps engineers and contractors select the best solution for performance, safety, and compliance. From small-scale residential wiring to large-scale industrial applications, the decision on whether to use a cable tray or a conduit lies on the scale of the job as well as the amount of heat the wires will generate. They're excellent for protecting individual circuits in harsh or public areas, but they're labour-intensive and slower on large cable counts. This dilemma?

Balancing the cable tray price per foot versus the cost of installation. Two common alternatives to open wiring (types of an enclosed wiring system) are cable conduit and cable tray.
