

Electricity meter wiring distribution box

Article Overview

The electricity meter is wired by connecting the utility supply to the meter, then routing the output through the main isolator and MCBs to the distribution board, with proper grounding and color-coded conductors.

Overview of Components

- **Electric Meter:** Measures electricity consumption and serves as the interface between the utility supply and the building.
- **Main Disconnect / Double-Pole MCB:** Acts as the main isolator for safety.
- **Distribution Board (Consumer Unit):** Contains single-pole or double-pole MCBs, RCDs, and busbars to distribute power to sub-circuits.
- **Busbars:** Separate bars for neutral and earth connections.
- **Protective Devices:** MCBs, RCDs, and fuses protect circuits from overloads and faults.

Wiring Steps

- **Safety First:** Disconnect the main supply before working inside the meter or distribution box to prevent electric shock or arc faults .
- **Mounting:** Securely mount the meter box and distribution board, typically 5 feet above ground for easy access .
- **Service Entrance:** Route the incoming utility conductors (line and neutral) from the transformer or pole into the meter socket. For single-phase systems, the line is usually red or black, and neutral is black or white depending on local code .
