

Fire Distribution Box Model List

Article Overview

Fire distribution boxes include manual fire alarm boxes, master fire alarm boxes, and fire extinguisher cabinets, each designed for specific fire safety applications.

Fire Alarm Boxes

Manual Fire Alarm Boxes are designed for direct human activation in case of fire. They operate by pulling a lever or handle, which triggers a coded signal to the central fire alarm system. These boxes are typically installed outside or near building entrances for easy access and are connected to a normally closed metallic signaling circuit carrying a small DC current for signal transmission (). Master Fire Alarm Boxes serve as the central link between auxiliary fire alarm systems and the main municipal or industrial fire alarm network. They can receive automatic signals from heat detectors, smoke detectors, or sprinkler systems and transmit them to the central headquarters. Master boxes often include provisions for electrical actuation in addition to manual operation and are recommended to be installed outside but near the building for safety and accessibility ().

Key Features of Fire Alarm Boxes:

- Coded signal transmission for precise location identification
- Manual activation with pull lever
- Compatibility with auxiliary and central fire alarm systems
- Installation on poles or walls with optional lightning protection
- Connection using #14 or #16 AWG conductors to supervisory panels ()
