

Fog light dimming module wiring

Article Overview

A fog light dimming module is typically wired using a relay, inline fuse, and a switch to safely control brightness while protecting the circuit.

Core Wiring Setup

- **Power Source and Fuse** Connect the positive terminal of the battery to the dimming module through an inline fuse rated slightly below the wire's current capacity. For most 12V fog light circuits, a 10–15A fuse is common, depending on the total wattage of the fog lights (e.g., two 35W lamps draw $\sim 5.8A$). This protects the wiring and module from overload.
- **Relay Integration** Use a 4- or 5-pin automotive relay to handle high current. The relay terminals are typically:
 - 30: Power input from the battery/fuse
 - 87: Output to the fog lights
 - 85 & 86: Coil terminals for triggering the relay
 - 87a (optional): Normally closed contact, usually unused in standard fog light circuitsThe dimming module can be connected to the relay's coil side to modulate the voltage or PWM signal, controlling the brightness without overloading the switch.
- **Switch and Control Wiring** Connect the dimming module's control input to a dash-mounted switch. The switch can be powered from an ignition-switched source to prevent accidental operation when the vehicle is off. Some modules allow integration with the headlight circuit so fog lights dim automatically when high beams are on.
