

Grounding requirements for relay protection windings

Overview

The National Electrical Code® (NEC®) has specific ground fault equipment protection requirements in 215. Low resistance grounding of the neutral limits the ground fault current to a high level (typically 50 amps or more] in order to operate protective fault clearing relays and current transformers. Why the power system needs to be protected?

All current and voltage vectors have 120 degrees phase. Why the power system needs to be protected?

All current and voltage vectors have 120 degrees phase shifts and a sum of 0. com 423-304-0843 Craig Wester Craig. com 678-591-5018 2 Course Agenda □ System Grounding □ Power System Protection • Why Protect?

- Symmetrical Components • ANSI/IEEE Device Numbers □. Grounded System – a system in which at least one conductor or point (usually the middle wire or neutral point of transformer or generator windings) is intentionally grounded, either solidly or through an impedance. This booklet has been written to provide a brief introduction to the major power systems and the devices manufactured by Bender which are best suited to protect these systems in case of a ground fault. The definition of grounding is commonly used for both.
