

Heated Distribution Box

Article Overview

A heated distribution box is a control and distribution unit for underfloor or surface heating systems, designed to manage heating circuits, sensors, and temperature controllers efficiently.

Overview

A heated distribution box serves as the central hub for distributing heat in underfloor or surface heating systems. It houses heating circuit distributors, temperature controllers, and sometimes additional components like fuses or terminals. These boxes ensure precise control, safety, and easy maintenance of heating systems while keeping wiring and piping organized .

Types and Materials

Heated distribution boxes come in various designs:

- Surface-mounted: Installed on walls, easy to access, often made of galvanized or painted sheet steel for durability and corrosion resistance .
- Flush-mounted: Installed within walls for a cleaner look, suitable for both new constructions and renovations .
- Materials: Options include plastic, sheet steel, or stainless steel, with protection classes ranging from IP44 to IP65, depending on environmental requirements .

Features

- Pre-wired and labeled: Many boxes come fully wired with terminals, wiring diagrams, and instructions, reducing installation time and errors .
