

How to configure IP on a core switch

Article Overview

To configure an IP address on a core switch, assign it to a management VLAN or Layer 3 interface using the CLI, then activate the interface and save the configuration.

Step 1: Access the Switch CLI

Connect to the switch using a console cable or via SSH if remote access is already enabled. Launch a terminal emulator (e.g., PuTTY) and log in with your credentials. Enter privileged EXEC mode by typing enable and providing the enable password .

Step 2: Enter Global Configuration Mode

From privileged mode, enter global configuration mode using:
configure terminal

This allows you to make changes to interfaces and VLANs .

Step 3: Configure the Management VLAN or Interface

For a Layer 2 switch, assign the IP address to the management VLAN (commonly VLAN 1):

```
interface vlan 1 ip address 192.168.1.10 255.255.255.0 no shutdown
```

For a Layer 3 (multilayer) switch, you can assign an IP directly to a routed interface:

```
interface gigabitEthernet 0/1 no switchport ip address 192.168.1.10 255.255.255.0 no shutdown
```

Replace 192.168.1.10 and the subnet mask with your network-specific values .
