

How to configure fiber optic cables 1 through 4 on a router

Article Overview

To configure multiple fiber optic cables on a router, each fiber line must connect through an ONT or SFP port, then be mapped to the router's WAN or LAN interfaces for proper network operation.

Step 1: Understand the Components

Each fiber optic cable from your ISP carries optical signals that must be converted to electrical signals before reaching your router. This is typically done via an Optical Network Terminal (ONT) or a router with SFP (Small Form-factor Pluggable) ports capable of handling fiber input . The ONT serves as the demarcation point between the ISP's fiber network and your home or office network.

Step 2: Physical Connection

- Connect each fiber cable (1 through 4) to the corresponding ONT or SFP port on your router. Ensure the connectors are clean and properly aligned; fiber connectors are sensitive to dirt and misalignment .
- If using an ONT, run an Ethernet cable from each ONT port to the router's WAN or designated LAN ports. Label each cable to match the fiber line number for easier management .
- Power on the ONT first, wait for the status lights to stabilize, then power on the router. This ensures the optical signal is properly converted before the router attempts to establish a connection .

Step 3: Router Configuration
