

How to connect junction boxes and distribution boxes

Article Overview

To connect a junction box to a distribution box, run properly rated wires from the distribution box to the junction box, ensuring correct color-coded connections, secure splicing, and proper grounding.

Understanding the Components

- **Distribution Box:** Also called a distribution board, it receives the main power supply and divides it into multiple circuits, each protected by circuit breakers or fuses. It ensures overload protection and safe power distribution across the system ().
- **Junction Box:** A protective enclosure used to safely connect and branch wires. It does not contain breakers but provides a secure point for splicing wires and distributing power to outlets, lights, or appliances ().

Step-by-Step Connection Process

- **Turn Off Power:** Switch off the main breaker in the distribution box to ensure safety before starting any wiring ().
- **Select Proper Wires:** Use wires rated for the voltage and current of the circuit. Typically, black or red wires are live, white is neutral, and green or bare copper is ground ().
- **Run Wires from Distribution Box to Junction Box:** Route the wires through conduits or cable trays, ensuring they are protected from physical damage.
- **Prepare Wires:** Strip about 3/4 inch of insulation from each wire end. Twist strands together if using stranded wire ().
