

How to connect the junction box and the distribution box

Article Overview

To connect a junction box to a distribution box, safely route and secure the wires, establish proper grounding, and match color-coded conductors before securing all connections inside the junction box.

Safety First

Before starting, turn off the power at the main distribution box and verify with a non-contact voltage tester that the circuit is de-energized to prevent electrical shock . Wear insulated gloves and safety goggles for protection.

Selecting and Preparing the Junction Box

Choose a junction box that is sized appropriately for the number of wires and connections it will contain, ensuring compliance with electrical codes . For damp or exposed areas, select a moisture-resistant or surface-mounted box. Strip about 3/4 inch (19 mm) of insulation from each wire entering the box, leaving enough length (6-8 inches) for splicing and management .

Routing Wires from the Distribution Box

Run the circuit cables from the distribution box to the junction box using approved cable clamps or connectors to prevent strain and protect the insulation . Ensure that the cables are long enough to reach the junction box comfortably.
