

How to connect the wiring to the emergency distribution box

Article Overview

Emergency wiring should be connected to a dedicated, unswitched circuit in the distribution box, with proper live, neutral, and earth connections, and integration of backup power according to safety standards.

Preparation and Safety

Before starting, turn off the main power at the breaker panel and verify zero voltage using a multimeter to ensure safety. Gather all necessary tools and materials, including wire strippers, screwdrivers, appropriate gauge wires, connectors, and a secure junction box if not integrated into the emergency unit. Confirm that the emergency lighting or backup system is compatible with the distribution box voltage and load requirements.

Distribution Box Considerations

Choose a distribution box suitable for the environment (indoor/outdoor) and load capacity, ensuring proper IP/NEMA ratings. Inside the box, ensure there are circuit breakers, busbars, terminal blocks, and DIN rails for mounting additional devices. Each emergency circuit should have its own overcurrent protection device rated according to the load.

Wiring Connections

- **Live (Unswitched) Connection:** Connect the unswitched live wire from the distribution box to the terminal marked "L" or "Live unswitched" on the emergency unit. This ensures continuous charging of the internal battery.
