How to view the core switch IP address

Article Overview

You can view a core switch's IP address using console access, CLI commands, DHCP lookup, or network discovery tools.

Direct Console Access

The most reliable method is to connect directly to the switch's console port using a console cable and a terminal emulator like PuTTY or SecureCRT. Once connected, enter privileged EXEC mode and run the command show ip interface brief to display all configured IP addresses, including the management VLAN (usually VLAN 1) or any other VLAN assigned for management purposes . This method works for both Layer 2 and Layer 3 switches.

Using CLI via SSH or Telnet

If the switch is already reachable on the network, you can connect via SSH or Telnet. Commands such as show mac address-table combined with show arp allow you to trace the MAC address of a connected device to the switch port, and then use show cdp neighbor detail to find the management IP of the switch . On Huawei switches, the display arp command can show IP addresses of directly connected servers and the interfaces they are connected to .

DHCP Server Lookup

If the switch obtains its IP address via DHCP, you can check the DHCP server or router's lease table. Look for the switch's hostname or MAC address in the client list to identify its assigned IP . This method is useful when you do not have physical access to the switch.
