

How to wire an indoor metal electrical distribution box

Article Overview

Wiring an indoor metal distribution box requires proper grounding, secure wire connections, and adherence to safety codes to ensure a safe and functional electrical system.

Preparation and Safety

Before starting, turn off the main power supply to prevent electric shock. Wear insulated gloves and use tools rated for electrical work. Ensure the metal box is properly mounted in a dry, accessible location, away from water or flammable materials, and at a convenient height for maintenance (typically around 1.5 meters) ().

Grounding the Metal Box

Metal boxes must be grounded to prevent electrical hazards. Connect a green or bare copper grounding wire from the grounding bar in the distribution box to the metal box using a grounding screw or clip. All incoming and outgoing metal conduit or armored cables should also be bonded to the box ().

Wiring Entry

There are several ways to bring wires into a metal box:

- Romex (NM) cable: Use a metal cable clamp to secure the cable at the entry point, stripping the outer sheath and exposing the conductors ().
- MC or armored cable: Insert through a knockout and secure with a connector.
