

How to wire the drawer cabinet switches

Article Overview

Wiring drawer cabinet switches requires careful planning, proper materials, and adherence to electrical safety codes to ensure safe and functional operation.

Planning and Safety

Before starting, turn off the circuit breaker supplying power to the cabinet area and verify with a non-contact voltage tester that the circuit is de-energized . Use GFCI protection if the drawer is near a sink or damp area, and ensure all wiring complies with the National Electrical Code (NEC) and local regulations . If unsure, consult a licensed electrician.

Choosing the Right Switch and Wiring

- **Switch type:** Select a switch rated for the voltage and current of your drawer outlet or light. For modular systems like Docking Drawer, follow the manufacturer's wiring diagrams for single or multiple switch configurations .
- **Wire type:** Use stranded wire for moving components, as it flexes without breaking, unlike solid wire . Standard THHN or UL-listed flexible cables are recommended for in-drawer applications.
- **Color coding:** Connect black (hot) wire to the brass terminal, white (neutral) to the silver terminal, and bare or green (ground) to the green screw .

Installation Steps

- **Mount the switch:** Drill or cut a hole in the cabinet or drawer face according to the switch dimensions. Secure the switch with screws or mounting hardware .
