

How to wire the intelligent power-off switch in the distribution box

Article Overview

An intelligent power-off switch is wired by connecting its control input to the live wire of the circuit, using relays or dry contacts to handle the load, and ensuring proper grounding and safety checks.

Step 1: Safety First

Before starting, turn off the main power supply at the distribution box to prevent electric shock. Use a non-contact voltage tester to confirm that no current is present in the wires you will work with. Wear insulated gloves and ensure the workspace is dry.

Step 2: Identify Components

For an intelligent power-off switch like the KC868-H8, the main interfaces include:

- DC 12V power port for the control module
- Relay output ports (dry contacts) to control high-power loads
- Signal input ports for sensors or triggers
- Network or RS232 ports for remote control

Step 3: Wiring the Switch

- Connect the live wire from the main circuit breaker to the input terminal of the intelligent switch or relay module.
