

Industrial switches repeatedly restart

Overview

Industrial switches may face power fluctuation, voltage spikes, heat buildup, vibration, EMI interference, poor grounding, and unstable DC input. If the switch is not designed for long-term industrial operation, these conditions can cause unexpected reboots and unstable. In industrial automation, a switch reboot is not just a small network problem. It can interrupt PLC communication, disconnect IP cameras, stop data transmission, trigger machine alarms, and even affect the entire production line. The output of the display reset-reason command executed in any view does not contain the reboot cause. Any idea?

01-24-2023 07:50 AM Hi, Most likely, you are encountering a bug in the OS you are running. If the following information is displayed, the device may. We are having one switch which from Cisco Catalyst 9300 Series, its rebooting unexpectedly. Please help me to resolve this issue. Do you send syslog messages to a collector?

if so can. A PLC restart loop typically means the CPU repeatedly tries to initialize but encounters a fault that prevents it from reaching "RUN" mode.
