

Installation of Dual-Port Information Panel Back Box

Article Overview

A dual-port information panel back box can be installed using surface or flush mounting, ensuring proper depth and cable management for Cat5/Cat6 connections.

Selecting the Back Box

Choose a back box that accommodates the type of modules you plan to install. For dual-port panels, ensure the box supports two keystone jacks or modular outlets. Surface mount back boxes are typically two-piece designs that snap together to adapt flush-mount products for surface installation, while flush-mount boxes fit within walls or panels. Depth selection is important: a 1.45" depth is suitable for standard voice jacks, while a 1.89" depth accommodates duplex or quad modules and ensures proper cable bend radius for Category 5 or 6 cables.

Mounting the Back Box

- **Surface Mounting:** Position the back box on the wall or panel surface. Use screws or anchors appropriate for the wall material. Snap the two-piece box together if required.
- **Flush Mounting:** Cut an opening in the wall or panel to match the back box dimensions. Insert the box and secure it with screws or mounting brackets. Ensure the box is level and firmly attached to prevent movement when inserting modules.

Wiring and Module Installation

- **Cable Preparation:** Strip the outer jacket of the network cable and untwist pairs carefully. Maintain the recommended bend radius to avoid signal degradation.
