

Large Size Distribution Box Panel

Article Overview

Large size distribution box panels are high-capacity electrical panels designed to safely distribute power across multiple circuits in commercial, industrial, or large residential applications.

Overview

A large distribution box panel (DB panel) serves as a central hub for electrical power, routing electricity from the main supply to various circuits while protecting the system from overloads, short circuits, and electrical faults (). These panels are essential in commercial buildings, industrial facilities, data centers, and large residential complexes where multiple circuits and high power loads are involved ().

Types of Large Distribution Panels

- **Main Circuit Breaker Panel (MCB Panel):** Houses the main breaker controlling the entire system, ideal for commercial and industrial applications ().
- **Main Lug Panel:** Lacks a main breaker and connects directly to a main panel or power source, often used as a sub-panel for secondary distribution ().
- **Sub-Panels:** Auxiliary panels connected to the main panel to distribute power to specific areas, floors, or zones, providing flexibility and localized control ().
- **Fuse Boxes:** Older type using fuses instead of breakers; less common in modern large installations ().
- **Transfer Switch Panels:** Enable switching between utility power and backup generators, critical for continuous power in hospitals, data centers, or industrial setups ().
