

OPCC optical cable

Article Overview

OPPC optical cable, or Optical Phase Conductor, is a composite cable that combines electrical power transmission and optical communication in a single overhead conductor.

Overview

OPPC (Optical Phase Conductor) is a specialized type of aerial cable that integrates optical fibers within a phase conductor used in electrical transmission and distribution systems . Unlike Optical Ground Wire (OPGW), which replaces the ground wire, OPPC replaces one of the live phase conductors, allowing the cable to carry both high-voltage electricity and high-speed data simultaneously . This dual functionality makes it ideal for modern power grids, smart grid applications, and communication networks along power lines.

Structure

The typical OPPC cable consists of:

- Optical fiber core: High-performance optical fibers for stable data transmission.
- Protective sheath: Encases the optical fibers to protect against mechanical stress and environmental factors.
- Power phase conductor: Conducts electrical current as part of the overhead line.
- Protective layers: Stainless steel tubes or aluminum-clad steel wires provide mechanical strength and electrical insulation . The cable can contain up to 144 optical fiber cores, depending on design, and is engineered to withstand high temperatures, electrical corrosion, and mechanical stress .
