

Perforation of small distribution boxes

Overview

Perforations, those series of small holes or cuts, transform ordinary boxes into convenient, interactive product packaging. Display packaging boxes benefit greatly from perforations. They allow you to create a tear-away section, revealing the product inside without entirely. Our previous work showed: Cutting tables can induce damage due to the tooling that influences the actual cut to uncut ratio. Is it the perforation or the fluting that is in charge?

Different liner materials and fluting types seem to respond similarly to different kinds. In this article published in Specialist Printing, our Sales Manager Matteo Muto explores the box-making process, highlighting the importance of techniques such as perforation, creasing, and special cuts (v-cut and half-cut) to create packaging that not only protects but enhances the contained. Perforated packaging unites visual appeal, easy-open functionality, and sustainability—granting brands a compelling edge in today's competitive environment. By adopting tear-away features, eco-friendly materials, and thoughtful die-cut designs, companies can reduce user hassle, better showcase. Perforation in packaging is designed with holes or cuts in a row. They apply to materials like cardboard and kraft paper.
