

Philippines SD-WAN device 800G

Article Overview

High-performance SD-WAN devices in the Philippines, including Cisco and Silver Peak solutions, support scalable enterprise networking, though 800G-capable devices are emerging and may require specialized modular systems.

High-Throughput SD-WAN Options

In the Philippines, Cisco SD-WAN routers are widely deployed for enterprise and data center networks. Cisco offers modular, high-density routers capable of up to 400G throughput, with scalable routing systems and segment routing for SLA-based services. These devices integrate WAN, switching, security, and multicloud connectivity in a single platform, and are designed for cloud-first environments, making them suitable for large enterprises seeking high-performance SD-WAN solutions. Silver Peak SD-WAN is another option, providing a software-defined WAN architecture that intelligently routes traffic across multiple transport services, including LTE, MPLS, and broadband. While specific throughput ratings like 800G are not publicly listed, Silver Peak's converged platform is designed to maximize application performance and support cloud and SaaS applications across multiple offices. Local providers such as Globe Business and InfoBan Communications offer SD-WAN solutions tailored for Philippine enterprises. These solutions emphasize plug-and-play deployment, edge-to-cloud security, centralized management, and intelligent traffic routing, which can optimize bandwidth usage and improve application performance across multiple branches. While standard devices may not reach 800G, combining multiple high-capacity links or modular routers can achieve aggregate throughput suitable for large-scale operations.
