

Relay protection sensitivity formula km

Overview

The relay settings are in terms of impedance that is R and X Total Positive sequence impedance of protected line with reference to primary $Z_{PL} = [Z_{PL} \text{ (Ohms /km)} * \text{Protected Line Length (km)}]$ $Z_{PL} W. T \text{ Primary} * (CT \text{ ratio}/PT \text{ ratio})$ Reactance of. Let us calculate the CR and IR set-tings based on the condition of equality of their sensitivity Fig. The. Line ZLL and second Adjacent Long Line Z2LL can be calculated. If there is more than one Transformer, the resultant Impedance considering the Transformers are in parallel is taken. The Limiting conditions for setting the distance relay reach to avoid encroachment into loads. Power system stability means also. The paper explains why distance protection applications in weak systems face additional challenges, provides a brief explanation of typical approaches to distance element design that alleviate some of the issues, and lists application recommendations for the users.
