

Replacing the circuit breaker in the distribution box

Article Overview

Replacing a circuit breaker involves turning off the main power, safely removing the faulty breaker, and installing a compatible new breaker while following strict safety precautions.

Safety First

Before starting, ensure the main power is turned off to prevent electrical shock. Use rubber-insulated tools, insulated gloves, and rubber-soled shoes when working inside the distribution box. Inspect the panel for rust, discoloration, charring, or moisture, and if any damage is present, contact a licensed electrician instead of attempting replacement yourself .

Step-by-Step Replacement

- **Locate the Distribution Box:** Identify the main breaker panel and the specific breaker to replace. Some homes may have multiple panels .
- **Remove the Panel Cover:** Use a screwdriver to remove the front cover, exposing the internal wiring and breakers .
- **Verify Power is Off:** Use a voltage detection probe to confirm that the circuit is de-energized .
- **Identify the Breaker Type:** Determine if it is a fixed breaker (screwed in) or plug-in type. Fixed breakers require unscrewing the terminal screws .
- **Disconnect Wires:** Loosen the terminal screws and carefully disconnect the wires from the faulty breaker .
