

ST to C fiber optic patch cord

Article Overview

An ST to C fiber optic patch cord is a short fiber cable with an ST connector on one end and a C-type connector on the other, used to connect devices in optical networks.

Overview

A fiber optic patch cord is a short cable with connectors at both ends, designed to connect network devices such as switches, routers, patch panels, or optical test equipment for signal routing . The ST connector is a bayonet-style connector commonly used in legacy networks, while the C-type connector (sometimes referred to as a CS or Centronic-style connector) is less common but may be used in specialized equipment .

Fiber Types

Patch cords can be made with single-mode (SM) or multimode (MM) fibers:

- Single-mode (9/125 μm , OS2): Supports long-distance transmission with low attenuation, ideal for telecommunications and FTTH applications, capable of distances up to 10 km at 1310 nm .
- Multimode (50/125 μm OM3/OM4): Supports higher bandwidth over shorter distances, suitable for data centers and LANs, with OM3 supporting 10 Gigabit speeds up to 300 meters and OM4 up to 400 meters .

Applications

ST to C patch cords are typically used for:

- Connecting patch panels to switches or routers
