

Should cable trays installed through computer rooms be covered with fireproof boards

Overview

Install fire barriers within the tray to isolate different fire zones. When cable trays pass through walls or floors, seal openings using fire-rated penetration sealing materials. Route Planning and Layout Principles Coordinate with Building Structure: Cable tray routing should align with architectural design, avoiding unnecessary. If there is a cable tray penetrating through a fire rated wall that is supporting services, then consideration should be given to how this may affect the fire safety of a building. Penetrations through fire walls present a risk to the containment of the spread of fire and should be protected with. Poorly fitted trays may serve as a fuse in case of a short or a top chimney in case of a fire. Understanding proper cable tray fire safety practices is essential for protecting buildings, equipment, and occupants. Commercial buildings. Particularly high requirements apply to fire protection in computer centres While, in the server rooms, it is primarily fire alarm technology and automatic extinguishing systems that are used, other building sections also require structural fire protection measures. To allow the continued supply of.
