

Telecom Fiber Optic Router Settings Entry

Article Overview

To connect a router to a fiber optic network, link it to the ONT, configure WAN/PPPoE settings with ISP credentials, update firmware, and secure your Wi-Fi network.

Connecting Your Router to Fiber

- **Identify the Optical Network Terminal (ONT):** The ONT converts fiber optic signals into Ethernet for your router. It is usually installed by your ISP and may have a dedicated Ethernet or SFP port labeled "LAN" or "ONT" .
- **Physical Connection:** Use an Ethernet cable to connect the ONT's Ethernet port to the WAN port of your router. Ensure both devices are powered on and indicator lights show active connectivity .
- **Router Compatibility:** Verify that your router supports fiber connections. Some routers require SFP modules or specific WAN ports for fiber input .

Router Configuration

- **Access the Admin Panel:** Open a web browser on a device connected to your router and enter the router's IP address (commonly 192.168.1.1 or 192.168.0.1). Login credentials are usually admin/password unless changed .
- **WAN/Internet Settings:** Navigate to the WAN or Internet settings section. Most fiber ISPs use PPPoE (Point-to-Point Protocol over Ethernet). Enter the username and password provided by your ISP. If you do not have these credentials, contact your ISP or check the customer portal .
