

The distribution box does not trip when the power is off

Overview

Be sure that the power distribution box has sufficient power provided to it. Long cable runs can result in a voltage drop, which can be solved by using a heavy gauge wire. When the lights go out, the first reaction is to check the electrical panel for a tripped circuit breaker. If all breakers are “on” but there is no power, the problem is likely upstream of the panel's individual circuits. These include having a faulty circuit breaker or breaker box, faulty wiring in the system, or a tripped GFCI outlet. When they start tripping, overheating, or making strange noises, it's more than just an inconvenience - it's your home's cry for help. This guide will walk you through exactly how to diagnose the issue step by step — and help you.
