

The fiber optic router is always plugged in and not unplugged

Overview

The most common causes of this are loss of power to the fiber terminal (ONT) or an unplugged network cable. Make sure you have an Ethernet cable plugged fully into the WAN port on the back of the modem. Check for red indicator lights signaling errors. The other end of this cable should be plugged into the active wall jack or indoor fiber. Is it safe to unplug the main power from the router and the box with all the green LEDs and after I clean up and organize the wiring just plug them back in?

Or is there a specific power down and power up sequence I should follow?

It really doesn't matter. But if you want things to come back as fast. This guide will provide you with step-by-step troubleshooting tips to identify and potentially resolve common fiber internet issues. By following these instructions, you may be able to restore your service without the need for additional support.
