

Three-hole electrical junction box

Article Overview

A three-hole junction box can be safely connected by identifying each wire, stripping the insulation, twisting wires together with wire nuts, and securing them in the box following proper safety procedures.

Step 1: Safety First

Before starting, turn off the power at the main service panel and verify that no current is present using a non-contact voltage tester. Wear rubber gloves and eye protection to prevent electrical shocks or injury from stray wire fragments .

Step 2: Prepare the Junction Box

Select a junction box suitable for your location and wire gauge. If the area is exposed to moisture, choose a weatherproof box. Ensure the box has enough volume to accommodate all wires, following the National Electrical Code guidelines for wire count and gauge .

Step 3: Strip and Identify Wires

Use wire strippers to remove about 3/4 inch (19 mm) of insulation from each wire entering the box. Identify the wires by color: black or red for hot, white or gray for neutral, and bare copper or green for ground .

Step 4: Make Connections

- Ground wires first: Twist all ground wires together with a pigtail and secure with a wire nut. Attach the pigtail to the box ground screw if the box is metal .
- Neutral wires: Twist all neutral wires together and secure with a wire nut.
