

What are the certifications for network security equipment

Article Overview

NESAS (Network Equipment Security Assurance Scheme) is the primary globally recognized certification framework for network equipment security.

NESAS Certification Overview

The Network Equipment Security Assurance Scheme (NESAS) is a security certification framework developed jointly by the GSMA and 3GPP to ensure the security of network equipment used in mobile and telecommunications networks . NESAS provides a security baseline for network devices through standardized assessments, helping reduce vulnerabilities and ensuring that equipment meets rigorous security requirements.

Key Features of NESAS

- **Security Baseline:** Establishes minimum security requirements for network equipment, including secure coding practices, testing procedures, and supply chain security .
- **Development and Product Lifecycle Assessment:** Evaluates vendor development processes and network functions throughout the product lifecycle, ensuring secure design, implementation, and maintenance .
- **Global Adoption:** NESAS is recognized worldwide, giving network operators and regulators confidence in certified equipment .
- **Periodic Reassessments:** Certification is not a one-time event; vendors must undergo regular evaluations to maintain compliance with NESAS standards .
