

What devices use photometer modules

Overview

Confocal microscopes, spectrophotometers, and many high-end automatic camera exposure bodies utilize photomultipliers to gauge light intensity. They use photomultiplier tubes, avalanche photodiodes, PN photodiodes, or PIN photodiodes. These detectors multiply. A photometer is a scientific instrument designed to measure the intensity of light, typically within the visible spectrum, where it is calibrated to match the human eye's response for quantities such as luminous flux or illuminance. Instruments intended for ultraviolet or infrared measurements are. Pendotech offers In-line Single-Use UV Absorbance and Turbidity measuring and monitoring tools. These tools collect data from bioprocess fluid streams during processing, reducing disruption compared to offline measurements.

Photomultiplier tubes (photomultipliers or PMTs for short) are extremely sensitive detectors of light in the ultraviolet, visible, and near-infrared ranges of the electromagnetic spectrum. They are members of the class of vacuum tubes, more specifically vacuum phototubes. These detectors multiply the current produced by incident light by as much as 100 million times or 10 (i.e., 160 dB), in multiple dynode stages, enabling (for
