

# What is a low-end industrial switch

## Overview

An L2 industrial switch (without PoE) is a rugged, managed switch operating at Layer 2 (Ethernet switching) but without built-in power delivery to end devices. These are used when devices already have local power, or when PoE is not needed. Their design must balance stability, reliability, and scalability. When selecting an industrial switch, network architects. An industrial switch (industrial Ethernet switch) is a hardened networking device designed for OT environments such as factories, substations, rail systems, outdoor installations, mining sites, oil platforms, and smart-city infrastructure. Commercial switches are typically housed in. This gives you the flexibility to build powerful and secure networks, even in harsh environments: copper and FO ports, as well as redundancy functions, enable the flexible networking of your systems and the easy segmentation of your industrial network. It operates at the data link layer of the OSI model and ensures seamless communication between devices by forwarding data packets.
