

What to do if fiber optic cable is accidentally cut

Article Overview

If a fiber optic cable is cut, the safest and most effective approach is to locate the damage, prepare the fiber ends, and repair them using fusion or mechanical splicing, while following strict safety precautions.

Immediate Safety Measures

Fiber optic cables carry invisible laser light and contain microscopic glass fibers that can cause injury. Never look directly into the fiber ends and always wear safety glasses with side shields and gloves to prevent eye damage and skin splinters when handling broken fibers . Avoid inhaling any airborne glass fragments.

Identifying the Damage

- Visual Inspection: Check for obvious cuts, crimps, kinks, or crushed sections along the cable .
- Signal Check: Observe the Optical Network Terminal (ONT) or network status lights; a red or blinking light often indicates a loss of optical signal .
- OTDR Testing: For precise fault location, use an Optical Time Domain Reflectometer (OTDR) to detect breaks or internal damage that may not be visible .

Preparing the Fiber for Repair

- Cut Out Damaged Section: Use a fiber optic cutter to remove the visibly damaged portion, leaving enough length for proper splicing .
